

# The benefits of SIP Trunks and ISDN Conversions

Fuse 2 can take your business communication to the next level by converting your existing telephone line to a modern IP enabled telephone line.

## Why convert?

### Save multiple costs

With a suitable internet connection, whether supplied and managed by Fuse 2 or an existing solution, SIP Trunks enable business voice calls to be routed through the internet via the Fuse 2 carrier grade network. Customers can see the benefits of competitive call rates (including international calls). For legacy systems which do not allow VoIP, Fuse 2 can install and manage ISDN conversion units which convert analogue calls to SIP, without affecting any aspect of the existing system. This eliminates costs such as hardware purchases, installation and maintenance costs.

### Enjoy many IP features

Converting enables your legacy phone systems to benefit from the following modern IP features:

- Call recording via SIP, not at PBX Level
- Competitive Rates
- Prepared for the ISDN phase out
- Reduced costs on lines coming into the business when numbers are ported

### Be ready for the future

The ISDN network (the traditional phone network) will be turned off in the next few years. By converting to a modern voice solution now, you'll be protecting any future investments you make within your communication network. When the ISDN network is turned off, you'll be ready for it.

There's never been a better time to switch

Our Fuse 2 experts have already made the switch for both small and large enterprises across the UK, instantly improving the running of their business and saving them money.
